Module Payment - API Integration

Resource for the assigned Payment team | Demo version 1.0

Scope

Create a payment intent for an order, record the outcome and handle duplicate requests safely. Use a fake provider adapter for this exercise.

API contract

POST /payments accepts orderId, amount and currency. GET /payments/{id} returns PENDING, SUCCEEDED or FAILED. Supply an idempotency key for creation.

Sample SDK

payment-sdk.zip contains JSON examples and integration notes. It contains no executable binaries or external credentials.

Acceptance checks

Reject non-positive amounts. A repeated creation request must not create another payment. Deny access to transactions outside the workspace.
