Module Auth - Functional Analysis

Resource for the assigned Auth team | Demo version 1.0

Scope

Implement registration, sign-in, sign-out and role checks. A student may access only the workspace of a team in which their membership is active.

API contract

POST /auth/register creates an account. POST /auth/login returns an access token. GET /auth/me returns the current identity and effective roles.

Sample dataset

auth-sample.csv contains fake role and account examples. Addresses use example.test and do not identify real people.

Acceptance checks

Reject invalid credentials. Return 403 for files outside the workspace. Do not expose private storage keys in resource listings.
