E-Commerce Hub - Architecture Spec

Shared master resource | *Demo version 1.0*

System boundaries

Auth manages user identity and access. Payment handles checkout and transaction state. Catalog owns products, categories and stock visibility.

Shared contract

Use JSON REST APIs, UUID business identifiers, UTC timestamps and a consistent error body. Each module owns its persistence model and publishes an OpenAPI contract.

Integration scenario

A signed-in customer browses an available product, creates an order and submits one payment request. Retrying a payment must keep the same payment reference.

Delivery milestones

Master: System architecture review on assignment day +3. Each module: Design API & Database on day +7, Integration & Testing on day +14.
